i3100 Browser-Based Transactions

**Outstanding Functionality Enhances Flexibility
to Provide Maximum Benefit!**

i3100 enables users to generate secure disbursement from anywhere within an organization. Users open their web browser, log in, select the transaction desired and enter the data. The transaction data created by i3100 is output in a standard XML format and ready to be process by any document production program.

Document production programs such as LinkUp Enterprise, the industry's most flexible, secure document production system, are configured to monitor i3100's XML output to process transactions generated and route the data to the appropriate output device. In addition, i3100 can serve as a backup when your host is down and critical documents must be processed: Users can complete work easily and conveniently from anywhere in the organization as long as they have access to your Intranet.

The i3100 program resides on an application server that provides services for web page support. Users connect to this application server through a standard browser, like Microsoft Internet Explorer. i3100 supports user logons, transaction selection and output processing.

Browser-Based Application Delivers Flexibility, Ease of Use

Since i3100 is browser-based, no client-side installation or maintenance is required. i3100 uses your existing network technology to provide a secure, network distributed data entry module to your entire user population.

Configurable at Field Level

This versatile technical solution is configurable at the field level, so the solution isn't limited by hard-coded

HTML configurations.

In addition, an organization's program administrator can configure at will, changing users or their parameters as frequently as desired.

Distributed Solution

i3100 offers a distributed solution, permitting your employees to stay with the customer while working on a transaction. It works well with LinkUp® Enterprise, that operated as a back-office product, providing you with all of your document output needs.

Technology Foundation Enables Superb Functionality

i3100's dynamically built HTML web pages support user level security, data validation, data auditing and PDF reporting from the user's workstation. While the web entry display is user friendly and personalized, the technology behind it is a very efficient NT server application created using stored procedures in a SQL database that processes entered data into an XML format. Built with the latest Microsoft® products, and using advanced technology approaches, the i3100 creates the most versatile browser-based transaction generator on the market.

Ideal for small, focused business applications:

- Counter checks
- Patient ID, forms, and labels
- Exception printing
- Gift certificates
- Downtime printing

...virtually any transaction based application

Standard Register – Advantage™

- **1 – Innovative Documents:** Documents are designed to reduce the number of forms and improve processes at the user level.
- **2 – Hardware & Supplies:** We test, market and support a variety of printers, ensuring our documents feed reliably. Some of the printers available with *LinkUp Enterprise* include Lexmark and Hewlett-Packard laser printers.
- **3 – Software:** Best-in-class software tools automate your documents and processes.
- **4 – Professional Services:** We configure the system with attention to optimizing workflow and design. Customers accomplish more initially with *LinkUp Enterprise* than with any competitor's system, even over a long period of time.
- **5 – National Service Organization:** All post-installation concerns are handled with one phone call to the *John Poulet Cheque Writer Service Ltd.* Help-Desk.
